The primary data source: log.jsonl (the 10 propose rounds, the same-round evaluates, the

plan revisions v1-v4, the endorse and the final entries). The simulation artifacts:

cell/r1_* ... cell/r10_* (the tool output JSONs).

The numbering note: the VBF code uses the case-ID token T6R1SINGLEMODEL (the verifier's

numbering format VBF---1 accepts the [A-Z0-9] charset only, so the

underscores of t6_r1_singlemodel are stripped).
